

Tippecanoe Warehouse Facility

- **Project Description:** The design team worked as part of a team to develop a chemical storage facility. This facility stores 40,000 square foot of space, including sampling rooms, cold and chill room storage, and office space. Six docks serve this facility to deliver product throughout the campus, as well as off-site delivery. Security for this project was high and was developed in accordance with the company's requirements. Although a warehouse, architectural detailing was requested and developed with a plant precast panel system. It was imperative that the system provide a continuous R-value over the entire face of the panel in order to provide the temperature controls required of the climatized facility.

The office space and interiors were developed following corporate standards, providing finishes that create an enjoyed ambience that most facilities would not normally attain, while staying below the projected budget.
